

Test Candidate

000-000-0000 | test.candidate@example.com | [Linkedin](#) | [GitHub](#) | Testville, TS

EDUCATION

San Jose State University

Master of Science in Software Engineering

Testville, TS

Aug. 2025 - May 2027

National Institute of Technology, Warangal

Bachelor of Technology in Computer Science and Engineering

Testville, TS

Aug. 2019 - May 2023

EXPERIENCE

MalyTech

June 2026 - Present

Software Engineering Intern

- Built the **anti-corruption layer** between a commercial bank's core systems and four external providers - telecom messaging, real-time interbank transfers, identity verification, and AML sanctions screening - then the **Core onboarding service** above those four as the single front door and system of record: **five asynchronous Python microservices** (FastAPI, SQLAlchemy 2.0, PostgreSQL).
- Engineered **exactly-once money movement** with INSERT-first idempotency reservation, atomic ON CONFLICT claims, and SHA-256 payload fingerprints, proven by an **8-way duplicate harness** to make one vendor call; the underlying real-time transfer adapter supported 8 transaction types with three-layer settlement validation.
- Designed a **fail-closed AML sanctions gateway** that errors on backend faults or invalid responses instead of returning a false clear, serving REST/JSON and legacy SOAP/XML from shared orchestration; hardened all four services with **credential isolation, recursive PII redaction, and XML-injection resistance**.

Amdocs Ltd.

July 2023 - June 2025

Software Developer

- Engineered and maintained **Java and Spring Boot microservices for the Order Management domain** (Catalog, Shopping Cart, Proposal and Agreement), with a **Jenkins-driven CI/CD pipeline** automating builds, tests, and deployments across OpenShift environments.
- Reduced production data footprint by ~40% and query time by ~25%** with policy-driven retention across three microservices; built REST lifecycle APIs, **Kafka-based archival**, and archive-before-delete ordering so removal followed confirmed archive completion.
- Reduced manual E2E effort by ~50% and cross-service defects by ~40%** with Postman/Newman tests in Jenkins and JSON-schema validation; **raised unit coverage to 90%** across four services using JUnit 5, Mockito, and WireMock while clearing ~500 SonarQube smells.
- Architected an immutable audit-trail system that **cut issue-resolution time by ~60%** - delegate-level Kafka triggers with correlation-ID propagation feeding a new consumer that persisted append-only, actor-attributed records in **Elasticsearch** - replacing multi-service log correlation with one filtered query.
- Redesigned the Kafka dead-letter-queue architecture, consolidating 862 per-consumer DLQ topics across 11 deployments into one shared DLQ per subdomain behind a feature-flagged HELM binding function - **cutting idle topic sprawl by 70% and reclaiming ~80% of wasted partitions**.

PROJECTS

Early Sepsis Prediction in the ICU | *Python, PyTorch, XGBoost, scikit-learn, SHAP*

Feb. 2026 - Apr. 2026

- Implemented a decay-aware GRU-D recurrent network in PyTorch from the original paper, learning per-feature decay over time-since-last-observation to model irregularly sampled vitals without imputation leakage - the best single model at 0.400 normalized utility.
- Ran a leakage ablation showing that removing the ICU length-of-stay feature collapsed Random Forest utility from 0.320 to -0.006, exposing a temporal shortcut that inflates much of the published sepsis literature.

Campus Marketplace | *Java 21, Spring Boot, PostgreSQL, AWS S3*

Sep. 2025 - Dec. 2025

- Built the backend for a campus peer-to-peer marketplace as primary developer on a 3-person team - a **17,000-line Java 21 and Spring Boot service** with 20 REST controllers, 24 JPA entities, and **30 Flyway-controlled PostgreSQL migrations**.
- Owned the listing and user domains, implementing **listing search and Amazon S3-backed photo upload**, plus role-based access control over **Spring Security with JWT authentication** and an OAuth2 resource server.

TECHNICAL SKILLS

ai_and_machine_learning: LLM Integration, Prompt Engineering, AI Agent Design, Structured Output Parsing | **languages:** Java, Python, C++, SQL | **frameworks:** Spring Boot, Spring MVC (REST), FastAPI, JUnit, Mockito | **libraries:** Apache Kafka, RabbitMQ, Elasticsearch, PyTorch, scikit-learn, XGBoost, PySpark | **apis_and_standards:** REST, JSON, OpenAPI/Swagger, OAuth2/JWT, HTTP | **developer_tools:** Jenkins, Maven, Docker, Git/GitHub, Bitbucket, Postman, OpenShift (OCP), SonarQube, IntelliJ | **databases:** PostgreSQL, Couchbase (SDK, N1QL), SQL (RDBMS)
